CMS Bushing Redesign

SKF Machine Tool Services is here to assist you with all your spindle requirements.

Here at SKF Machine Tool Services we have the customer in mind.

When many customers were having problems with a CMS spindle's drawbar bushing and springs, a redesign was required. To create a better fit, the springs were ground on the inner and out bevel edge.

To aid in the movement of the springs a powder coating was applied to the bushing giving a dry lubrication. The powder coating also gave the bushing more durability and longevity.

CMS Bushing with Converted Springwashers

- Springs ground to allow for proper fit.

- Bushing is powder coated, creating a dry lubrication.
