

# SKF Explorer steel/steel plain bearings

Robust and virtually maintenance-free for reduced costs and optimized field performance

## SKF EnCompass Field Performance Programme: theory meets reality

One might think that two bearings of the same size with the same dynamic load rating should perform equally well in a given application. In reality, they often do not. The reason?

Bearing performance under actual operating conditions is impacted by not only the dynamic load rating (C), but far more by the bearing's inherent design and quality -everything from the surface finish of the raceways to the effectiveness of sealing and lubrication.

The SKF EnCompass Field Performance Programme addresses this issue. By focusing on bearing design optimization and more detailed analysis of the factors influencing bearing service life, the programme will help to meet real-world application conditions.

At the heart of the SKF EnCompass are new, more inclusive bearing life models including a new basic rating life formula for SKF Explorer steel/steel plain bearings. By encompassing more of the factors that impact bearing service life, this model and new software tool provide new insight into the calculation of bearing rating life. The result is a significantly improved guide for selecting bearings for optimum reliability and productivity in the field.

As part of the SKF EnCompass programme, SKF Explorer steel/steel plain bearings have been optimized to give you a field performance advantage.

# Optimized for performance without compromise

SKF Explorer steel/steel plain bearings are virtually maintenance-free\* and extremely robust – the optimal combination for reducing costs and improving reliability.

## Reduce costs

SKF Explorer steel/steel plain bearings are initially lubricated and sealed to eliminate the need for relubrication in applications with low to moderate levels of contamination, such as those in off-highway applications. This generates significant savings by reducing maintenance costs and grease consumption. These virtually maintenance-free bearings also improve reliability by eliminating failures due to missed lubrication intervals and improper lubrication practices. All of this adds up to reduced Total Cost of Ownership (TCO).

## Improved robustness and dynamic load rating

Combining improved corrosion resistance, heavy-duty sealing and a relubrication-free design with a steel/steel sliding combination makes SKF Explorer steel/steel plain bearings more robust than ever. Plus, extensive research and testing under extreme loads has resulted in increased dynamic load ratings for SKF Explorer steel/steel plain bearings, an increase of 50% when compared to conventional steel/steel bearings.

### End-user benefits

- Reduced Total Cost of Ownership
- Reduced maintenance costs
- Reduced grease consumption
- Increased uptime
- Improved reliability
- Reduced environmental impact
- Retrofittable and interchangeable

### OEM benefits

- Improved differentiation in the market
- Reduced operation costs for customers
- Reduced environmental impact
- Reduced warranty claims

\* Virtually maintenance-free means that the bearing should function as intended without being relubricated as long as the tribological system is not compromised. The term maintenance-free does not imply that these bearings should not be inspected as part of a regularly scheduled maintenance programme.

# SKF Explorer steel/steel plain bearings:

## Reduced Total Cost of Ownership (TCO)

SKF Explorer steel/steel plain bearings can offer significantly longer service life compared to conventional steel/steel plain bearings and they are virtually maintenance-free. Direct savings result from fewer bearing replacements, plus longer service life means less machine downtime and lost production for repairs. When combined with the savings associated with not having to relubricate, SKF Explorer steel/steel plain bearings offer reduced total cost of ownership (→ **diagram 1**).

## Longer basic rating life

To prove the effectiveness of the new tribological system, SKF Explorer steel/steel plain bearings were tested against conventional steel/steel plain bearings. The extensive laboratory and field tests showed that the relubrication-free SKF Explorer steel/steel plain bearings last significantly longer than the conventional bearings, even when they were frequently relubricated.

The positive results from these tests are the basis for the determination of basic dynamic load ratings and the basic rating life calculation for SKF Explorer steel/steel plain bearings.

## Dynamic load ratings

In line with established practice, the dynamic load rating for SKF Explorer steel/steel plain bearings has been determined from extensive research and life testing. The result is a dynamic load rating that is 50% higher compared to conventional steel/steel plain bearings with the specific load factor  $K$  being increased from 100 to 150  $\text{N}/\text{mm}^2$  (→ **diagram 2**). This opens up a wider range of potential applications and the possibility for downsizing.

## Reduce environmental impact

In addition to using non-toxic grease in SKF Explorer steel/steel plain bearings, once they are sealed, the tribological system is so robust that relubrication is not necessary. The result: no additional grease is consumed and no grease is purged from the bearings, which significantly reduces environmental impact.

## Wear and corrosion-resistant

SKF Explorer steel/steel plain bearings are phosphated and then undergo further treatment to improve wear resistance and minimize the risk of corrosion.

Diagram 1

## Retrofittable

SKF Explorer steel/steel plain bearings can replace all conventional open or sealed radial steel/steel plain bearings currently available in the market place.

## Wide temperature range

The seals and grease can accommodate operating temperatures ranging from  $-45$  to  $+110$   $^{\circ}\text{C}$  ( $-45$  to  $+230$   $^{\circ}\text{F}$ ).

Diagram 3

## Test results: seal life

Seal life [%]

Fig. 1

## Sealed for protection

SKF Explorer steel/steel plain bearings are equipped with triple-lip heavy-duty contact seals. These seals, designed for contaminated environments, do an excellent job protecting the bearing's tribological system over the life of the bearing. SKF triple lip heavy-duty contact seals are the standard sealing solution for all SKF Explorer steel/steel plain bearings .

To perform well for long periods, the seal is reinforced with a stamped steel insert (→ **fig. 1**). The steel insert protects the seal lips from larger sized contaminants. It also significantly increases the seal's retention forces and stiffness. The design of the seal lips retains the lubricant while virtually eliminating the ingress of contaminants into the bearing (→ **fig. 2**).

## Seal life test results

Tests showed that SKF heavy-duty contact seals last up to three times longer than standard seals (→ **diagram 3**). Made of oil and wear-resistant acrylonitrile-butadiene rubber (NBR), the seals are highly resistant to aging and deformation, which further extends the service life of these seals.

# Selection of bearing size

## Load ratings

There is no standardized method for determining the load ratings of spherical plain bearings and rod ends, nor is there any standardized definition. As different manufacturers define load ratings differently, it is not possible to compare the load ratings of bearings produced by one manufacturer with those of another.

### Basic dynamic load rating

The basic dynamic load rating  $C$  is used, together with other influencing factors, to determine the basic rating life of spherical plain bearings and rod ends. As a rule, it represents the maximum load that a spherical plain bearing or rod end can accommodate at room temperature when there is movement between the sliding contact surfaces (→ **fig. 3**). The maximum load in any application should always be considered in relation to the required rating life. The basic dynamic load ratings quoted in the product tables are based on the specific load factor  $K$  (→ **table 1**) and the area of the projected sliding surface.

### Basic static load rating

The basic static load rating  $C_0$  represents the maximum permissible load that a spherical plain bearing or rod end can accommodate when there is no relative movement between the sliding contact surfaces (→ **fig. 4**). For spherical plain bearings, the basic static load rating represents the maximum load that the bearing can accommodate at room temperature without inadmissible deforming, fracturing or damaging the sliding contact surfaces.

The basic static load ratings quoted for SKF spherical plain bearings are based on a specific static load factor  $K_0$  (→ **table 1**) and the area of the projected sliding surface. It is assumed that the bearing is adequately supported. To fully exploit the static load rating of a spherical plain bearing, it is generally necessary to use shafts and housings made of high-strength materials. The basic static load rating must also be considered when bearings are dynamically loaded and subjected to additional heavy shock loads. The total load in these cases must not exceed the basic static load rating.

For rod ends, it is the strength of the housing at room temperature, under a constant load acting in the direction of the shank axis, that is the determining factor. The basic static load rating represents a safety factor of at least 1,2 relative to the yield strength of the material of the rod end housing, under the above conditions.

Table 1

## Specific load factors

–	N/mm <sup>2</sup>	
Metric sizes	150	500
Inch sizes	150	300

## Basic rating life

For spherical plain bearings, a lubricant film that fully separates the sliding contact surfaces cannot be formed. Therefore, the sliding contact surfaces make direct contact with each other, resulting in a certain and unavoidable degree of wear. This increases the internal clearance in the bearing.

Regarding the life of spherical plain bearings or rod ends, a distinction is made between the basic rating life and the service life. The basic rating life is a theoretical guideline value used when selecting a bearing for a particular application. Service life depends on the actual operating conditions and is the actual life achieved by an individual bearing in service.

The basic rating life is based on a large number of laboratory tests. Bearings were tested for an operating period until a specific increase in bearing clearance ( $>0,004 d_k$ ) or friction ( $\mu > 0,2$ ) occurred. The basic rating life considers several influencing factors and can be expressed in operating hours or the number of oscillating movements ( $\rightarrow$  fig. 5). In some cases, however, it is not possible to quantify factors such as contamination, corrosion and complex kinematic loads. Therefore, the basic rating life can be attained or exceeded by the majority of many apparently identical spherical plain bearings under the same operating conditions.

The service life cannot be calculated as it is too complex to determine and evaluate all the influencing factors. Therefore, depending on the application conditions, the service life may differ from the basic rating life.

**NOTE:** By using the SKF Bearing Calculator, it is possible to perform the necessary calculations to select a spherical plain bearing with the click of a mouse.

The SKF Bearing Calculator is available online at [skf.com/bearingcalculator](http://skf.com/bearingcalculator).

$\varphi = \text{angle of oscillation} = 2 \beta$

A complete oscillation is from point 0 to point 4 and =  $4 \beta$

# Selection of bearing size

## Load

When considering load, a distinction is made between:

- Load direction
  - radial load (→ **fig. 6**)
  - axial load (→ **fig. 7**)
  - combined (axial and radial) load (→ **fig. 8**)
- Type of load
  - dynamic load, i.e. there is relative sliding movement in the loaded bearing
  - static load, i.e. there is no relative movement in the loaded bearing
- Load conditions
  - constant load (→ **fig. 9**), i.e. the direction in which the load is applied does not change and the same part of the bearing (loaded zone) is always subjected to the load
  - alternating load (→ **fig. 10**), i.e. change of load direction so that zones at opposite positions in the bearing are alternately loaded and unloaded

## Equivalent dynamic bearing load

The load can be inserted directly into the equation for the specific bearing load  $p$  (→ **page 10**), if the magnitude of the load is constant and if the load acting on:

- Radial spherical plain bearings is purely radial
- Rod ends is purely radial and in the direction of the shank axis

In all other cases it is necessary to calculate the equivalent dynamic bearing load  $P$ . If the magnitude of the load is not constant, use the equation provided in the section “Variable load and sliding velocity” in the main catalog for spherical plain bearings and rod ends.

Radial spherical plain bearings can accommodate a certain magnitude of axial load  $F_a$  in addition to a simultaneously acting radial load  $F_r$  (→ **fig. 8**). When the resultant load is constant in magnitude, the equivalent dynamic bearing load can be calculated using

$$P = y F_r$$

where

$P$  = equivalent dynamic bearing load [kN]

$F_r$  = radial component of the load [kN]

$y$  = load factor that depends on the ratio of the axial to the radial load  $F_a/F_r$  (→ **diagram 4**)

## Equivalent static bearing load

If spherical plain bearings and rod ends are subjected to static loads, or very slight alignment movements, then the permissible load is not limited by wear, but by the strength of the sliding contact layer or the strength of the rod end housing.

If the actual load is a combined load, then an equivalent static bearing load must be calculated. For radial spherical plain bearings, it can be calculated using

$$P_0 = y F_r$$

where

$P_0$  = equivalent static bearing load [kN]

$F_r$  = radial component of the load [kN]

$y$  = load factor that depends on the ratio of the axial to the radial load  $F_a/F_r$  (→ **diagram 4**)

## Permissible loads for rod ends

Rod ends are primarily intended for the support of radial loads acting in the direction of the shank axis. If loads act at angles to the shank axis (→ **fig. 11**), the maximum permissible load is reduced, as additional bending stresses occur in the shank. Under these conditions, consider the design and material used for the rod end housing (→ **table 7, page 17**).

The load acting perpendicular to the direction of the shank axis should never exceed the value of  $0,1 C_0$ . If heavier loads are involved, a larger rod end should be selected.

The maximum permissible load for a rod end in the direction of the shank axis can be calculated using

$$P_{perm} = C_0 b_2 b_6$$

where

$P_{perm}$  = maximum permissible load [kN]

$C_0$  = static load rating [kN]

$b_2$  = 1 for SKF Explorer steel/steel rod ends, maximum allowable temperature 110 °C

$b_6$  = factor for the type of load (→ **table 2**)

# Selection of bearing size

## Requisite bearing size

To determine the requisite size of a spherical plain bearing or rod end, it is necessary to know the requisite rating life for the application. This depends on the type of machine, the operating conditions and the demands regarding operational reliability. The following steps can be used to determine requisite bearing size:

- 1 Use, as a guideline, a value of 2 for the load ratio  $C/P$  for spherical plain bearings and rod ends to obtain a requisite basic dynamic load rating  $C$ . Compare this value with the basic dynamic load rating of the bearings listed in the product tables.
- 2 Use the  $p$  $v$  diagram (→ **diagram 5**) to check if the selected SKF Explorer steel/steel plain bearing or rod end can be used under the actual load and sliding velocity conditions. The specific bearing load  $p$  and the sliding velocity  $v$  needed to perform this check can be calculated as explained in the following sections:
  - 2.1 If the  $p$  $v$  diagram indicates that the basic rating life equation can be used, proceed to step 3.
  - 2.2 If the  $p$  $v$  diagram shows that the  $p$  $v$  range is exceeded, select a bearing with a higher load carrying capacity.

3 Calculate the basic rating life (→ **page 12**) and proceed as follows:

- 3.1 If the calculated rating life is shorter than the requisite rating life, a larger bearing or rod end should be selected and the calculation repeated.
- 3.2 If the calculated rating life is larger than the requisite rating life, the bearing or rod end can be selected for the application.

The bearing or rod end size is often determined by the dimensions of the associated components. In these cases, check the  $p$  $v$  diagram to determine if the product is suitable.

### Specific bearing load

The magnitude of the specific bearing load can be calculated using

$$p = K \frac{P}{C}$$

where

$p$  = specific bearing load [N/mm<sup>2</sup>]

$K$  = specific load factor for SKF Explorer  
 $K = 150$  [N/mm<sup>2</sup>]

$P$  = equivalent dynamic bearing load [kN]

$C$  = basic dynamic load rating [kN]

### Mean sliding velocity

The mean sliding velocity for constant movement can be calculated using

$$v = 5,82 \times 10^{-7} d_k \beta f$$

where

$v$  = mean sliding velocity [m/s]

When the operation is intermittent (not continuous), the mean sliding velocity should be calculated for a cycle of operation

$d_k$  = inner ring sphere diameter [mm]

$\beta$  = half the angle of oscillation (→ **fig. 5, page 7**), degrees [°], for rotation  $\beta = 90^\circ$

$f$  = frequency of oscillation [min<sup>-1</sup>], or rotational speed [min<sup>-1</sup>]

For intermittent movement, the angle of oscillation is usually given in units of time. In this case the mean sliding velocity can be calculated using

$$v = 8,73 \times 10^{-6} d_k \left( \frac{4\beta}{t} \right)$$

where

$\beta$  = half the angle of oscillation [°]  
(→ **fig. 5, page 7**)

$t$  = time taken to pass through complete oscillation [s]

# Selection of bearing size

## Basic rating life calculation

The basic rating life for SKF Explorer steel/steel plain bearings can be calculated using

$$G_h = b_1 b_2 b_3 b_5 \frac{5}{p^{0.6} \times v^{1.6}}$$

where

$G_h$  = basic rating life, operating hours [h]

$b_1$  = load condition factor

$b_1 = 1$  for constant direction load

$b_1 = 2$  for alternating direction load

$b_2$  = temperature factor (→ **diagram 6**)

$b_3$  = sliding factor (→ **diagram 7**)

$b_5$  = factor for angle of oscillation  
(→ **diagram 8**)

$p$  = specific bearing load [N/mm<sup>2</sup>]  
(for values of  $p < 10$  N/mm<sup>2</sup> use  
 $p = 10$  N/mm<sup>2</sup>)

$v$  = mean sliding velocity [m/s]

Diagram 6

Temperature factor  $b_2$  for SKF Explorer steel/steel plain bearings

If  $-45\text{ °C} < T < 0\text{ °C}$ , the value of  $b_2$  for  $T = 0\text{ °C}$  should be used.

Diagram 7

Sliding factor  $b_3$  for SKF Explorer steel/steel plain bearings

Factor  $b_5$  for angle of oscillation for SKF Explorer steel/steel plain bearings

If  $\beta > 45^\circ$ , the value of  $b_5$  for  $\beta = 45^\circ$  should be used.

# Calculation examples

The following calculation example illustrates the methods used to determine the requisite bearing size or the basic rating life for an SKF Explorer steel/steel spherical plain bearing.

## Linkages of a flap opening system

### Given data:

Purely radial load that alternates direction

$$F_r = 16 \text{ kN}$$

Half angle of oscillation:  $\beta = 5^\circ$  (→ **fig. 5, page 7**)

Frequency of oscillation:  $f = 40 \text{ min}^{-1}$

Maximum operating temperature:  $+80^\circ\text{C}$

### Requirements:

The bearing must have a basic rating life of 7 000 h and no relubrication should be done.

### Calculation and selection:

Because the bearing needs to accommodate alternating loads in an application with a small oscillation angle and without relubrication, an SKF Explorer steel/steel plain bearing is chosen.

If, for the first check, a guideline value of 2 is used for the load ratio  $C/P$  (→ **page 10**), the required basic dynamic load rating  $C$  for the bearing is

$$C = 2 P = 32 \text{ kN}$$

Bearing GE 20 ESX-2LS, with a dynamic load rating  $C = 44 \text{ kN}$  and a sphere diameter  $d_k = 29 \text{ mm}$ , is chosen from the product table on **page 18**.

To check the suitability of the bearing using the  $pv$  diagram (→ **diagram 5, page 11**), calculate the specific bearing load using  $K = 150 \text{ N/mm}^2$  (→ **table 1, page 7**).

$$p = K \frac{P}{C} = 150 \times \frac{16}{44} = 54,5 \text{ N/mm}^2$$

and the sliding velocity  $v$  (**page 10**) using  $d_k = 29 \text{ mm}$ ,  $\beta = 5^\circ$  and  $f = 40 \text{ min}^{-1}$

$$\begin{aligned} v &= 5,82 \times 10^{-7} d_k \beta f \\ &= 5,82 \times 10^{-7} \times 29 \times 5 \times 40 \\ &= 0,0034 \text{ m/s} \end{aligned}$$

The values for  $p$  and  $v$  lie within the permissible operating range I of the  $pv$  diagram (→ **diagram 5, page 11**), for SKF Explorer steel/steel plain bearings. To calculate the basic rating life, the values that apply are

$$b_1 = 2 \text{ (alternating direction load, page 12)}$$

$$b_2 = 0,64 \text{ (from diagram 6, for } T = 80^\circ\text{C)}$$

$$b_3 = 1,45 \text{ (from diagram 7, for } d_k = 29 \text{ mm)}$$

$$b_5 = 1,0 \text{ (from diagram 8, for } \beta = 5^\circ)$$

$$p = 54,5 \text{ N/mm}^2$$

$$v = 0,0034 \text{ m/s}$$

$$\begin{aligned} G_h &= b_1 b_2 b_3 b_5 \frac{5}{p^{0,6} \times v^{1,6}} \\ &= 2 \times 0,64 \times 1,45 \times 1 \times \frac{5}{54,5^{0,6} \times 0,0034^{1,6}} \\ &\approx 7\,500 \text{ operating hours} \end{aligned}$$

Therefore, the selected bearing GE 20 ESX-2LS meets the requirements.

**NOTE:** The SKF Bearing Calculator incorporates programmes to perform these and many other calculations quickly and accurately. These programmes can be run any number of times to find the best possible solution. The SKF Bearing Calculator is available online at [skf.com/bearingcalculator](http://skf.com/bearingcalculator).

# Mounting and handling instructions

SKF Explorer steel/steel plain bearings should not be lubricated\*. These bearings are lubricated at the factory under well-controlled conditions. Introducing a foreign grease will only reduce the effectiveness of the tribological system. When mounting, do not swivel the bearing to the point where grease will be displaced from the bearing.

Skill and cleanliness when mounting are necessary if spherical plain bearings and rod ends are to achieve maximum service life and not fail prematurely.

Bearings and rod ends should only be removed from their packages immediately prior to mounting so that they do not become contaminated. All associated components should be clean and free of any burrs.

When heating the bearing for mounting, do not exceed the temperature limit of 110 °C.

SKF Explorer steel/steel plain bearings come with a notched and fractured outer ring. It is beneficial for service life that the joint is positioned at 90° to the direction of the load (→ **fig. 12**).

Also make sure to check each associated component for dimensional accuracy before the installation process is started. Recommended fits for shaft and housing can be found in **tables 3** and **4**.

## Further information

Please refer to the latest catalog for SKF spherical plain bearings and rod ends or to [skf.com](http://skf.com) for more general information in regards to:

- Variable load and motion
- Design of bearing arrangements
- Mounting instructions

Fig. 12

Plane of fracture or split and main direction of load

\* The bearings still have lubrication holes for manufacturing reasons. Do not apply grease to the bearing. Greasing or re-greasing the bearings will compromise the maintenance-free operation of the bearings and void the service life commitment provided by SKF with the original bearing.

Table 3

**Shaft fits<sup>1)</sup>**

Operating conditions	Tolerance classes
<b>Radial spherical plain bearings</b> Loads of all kinds, interference fit	m6 <sup>Ⓔ</sup> (n6 <sup>Ⓔ</sup> )
Loads of all kinds, clearance or transition fit	h6 <sup>Ⓔ</sup> (hardened shaft)

The tolerance classes in brackets should be selected for very heavily loaded bearings. If selected, be sure that the residual operating clearance is sufficient for proper performance of the bearing or whether a bearing with larger internal clearance must be used.

Operating conditions	Tolerance classes
<b>Radial spherical plain bearings</b> Light loads, axial displacement required	H7 <sup>Ⓔ</sup>
Heavy loads	M7 <sup>Ⓔ</sup> (N7 <sup>Ⓔ</sup> )
Light alloy housings	N7 <sup>Ⓔ</sup>

The tolerance classes in brackets should be selected for very heavily loaded bearings. If selected, be sure that the residual operating clearance of the radial bearing is sufficient for proper performance or whether a bearing with larger internal clearance must be used.

<sup>1)</sup>All ISO tolerance classes are valid with the envelope requirement in accordance with ISO 14405-1.

# Bearing data – general

## The assortment

SKF Explorer steel/steel plain bearings are available in the GE, GEH, GEM and GEZ, GEZH and GEZM series. The sliding surfaces are treated further to improve wear and corrosion resistance. The outer ring is intentionally fractured to allow for the inner ring to be inserted. The bearings are non-separable.

Rod ends of series SI(A) and SA(A) can also be equipped with these spherical plain bearings.

## Dimensions

Boundary dimensions of metric SKF Explorer steel/steel plain bearings are in accordance with ISO 12240-1:1998

- GE .. ESX-2LS and GEH .. ESX-2LS series
- GEM .. ESX-2LS series except for the inner ring

Boundary dimensions of inch SKF Explorer steel/steel plain bearings are in accordance with ANSI/ABMA Std. 22.2-1988

- GEZ .. ESX-2LS and GEZH .. ESX-2LS series
- GEZM .. ESX-2LS series except for the inner ring

The dimensions of SKF rod ends are in accordance with the standards SA(A), SI(A) ISO 12240-4:1998 dimension series E, EH.

Male and female threads of SKF rod ends are in accordance with ISO 965-1:1998.

Fig.13

### GE .. ESX-2LS

Metric radial spherical plain bearings.  
Range: 20 to 300 mm bore.

### GEZ .. ESX-2LS

Inch size radial spherical plain bearings.  
Range: 1 to 6 inch bore.

Fig.14

### GEH .. ESX-2LS

Metric radial spherical plain bearings as GE .. ESX-2LS, but with wider inner ring and larger outside diameter.  
Range: 20 to 120 mm bore.

### GEZH .. ESX-2LS

Inch size radial spherical plain bearings, as GEZ .. ESX-2LS, but with wider inner ring and larger outside diameter.  
Range: 1,25 to 5,5 inch bore.

Fig.15

### GEM .. ESX-2LS

Metric radial spherical plain bearings, as GE .. ESX-2LS, but with a cylindrical extension on both sides of the inner ring.  
Range: 20 to 80 mm bore.

### GEZM .. ESX-2LS

Inch size radial spherical plain bearings, as GEZ .. ESX-2LS, but with a cylindrical extension on both sides of the inner ring.  
Range: 1 to 6 inch bore.

## Tolerances

SKF metric radial spherical plain bearings are manufactured to tolerances in accordance with ISO 12240-1:1998. SKF inch radial spherical plain bearings are manufactured to tolerances in accordance with ANSI/ABMA Std. 22.2-1988.

### Radial internal clearance

SKF Explorer steel/steel radial plain bearings are produced with normal radial internal clearance as standard. The actual values are listed in **tables 5** and **6**.

## Materials

SKF Explorer steel/steel plain bearings are made of high grade carbon chromium steel that has been hardened, ground and phosphated. They are equipped with two triple-lip heavy-duty contact seals made of acrylonitrile-butadiene rubber (NBR). SKF Explorer rod end housings are made of the materials listed in **table 7**.

The rod end housings are equipped with lubrication holes due to manufacturing reasons, which are plugged to avoid contamination and relubrication.

### Permissible operating temperature range

SKF Explorer steel/steel radial plain bearings and rod ends have a permissible operating temperature range of -45 to +110 °C.

Table 5

Radial internal clearance for SKF Explorer steel/steel spherical plain bearings, metric sizes

Bore diameter		Radial internal clearance	
d over	incl.	Normal min	max
mm			
-	12	32	68
12	20	40	82
20	35	50	100

<sup>1)</sup> Dynamic load rating of the bearing to be used for basic rating life calculation only.  
Check suitability of the rod end against its static load rating in all cases.  
The dynamic load applied on the rod end must not exceed its static load rating.

## The Power of Knowledge Engineering

Combining products, people, and application-specific knowledge, SKF delivers innovative solutions to equipment manufacturers and production facilities in every major industry worldwide. Having expertise in multiple competence areas supports SKF Life Cycle Management, a proven approach to improving equipment reliability, optimizing operational and energy efficiency and reducing total cost of ownership.

These competence areas include bearings and units, seals, lubrication systems, mechatronics, and a wide range of services, from 3-D computer modelling to cloud-based condition monitoring and asset management services.

SKF's global footprint provides SKF customers with uniform quality standards and worldwide product availability. Our local presence provides direct access to the experience, knowledge and ingenuity of SKF people.

## SKF BeyondZero

SKF BeyondZero is more than our climate strategy for a sustainable environment: it is our mantra; a way of thinking, innovating and acting.

For us, SKF BeyondZero means that we will reduce the negative environmental impact from our own operations and at the same time, increase the positive environmental contribution by offering our customers the SKF BeyondZero portfolio of

products and services with enhanced environmental performance characteristics.

For inclusion in the SKF BeyondZero portfolio, a product, service or solution must deliver significant environmental benefits without serious environmental trade-offs.
