Flow limiter SP/SMB14
for line installation in circulating-oil lubrication systems.

Flow limiters are used in circulating-oil lubrication systems. The task of a flow limiter is to divide up the volumetric flow of the main line into parallel individual volumetric flow quantities and to “limit” these according to requirements, or to keep them constant. The volumetric flow produced does not depend on the system pressure and is nearly independent of viscosity.

Using interchangeable plug-in nozzles, the volumetric flow of the flow limiter SP/SMB14 can be set stepwise from 25 to 132 l/min. That makes it possible to adjust the volumetric flow rates at a later date. The SP/SMB14 group comes with a visual/electric gear wheel-type flow indicator that has a proportional factor of 106 ml per revolution.

**Advantages**

- **reliable**
  - Parallel distribution of individual flow quantities
  - Self-regulating metering, thus even volumetric flows for different back pressures
  - Wide viscosity spectrum, practically independent of temperature and viscosity, thus stable system conditions.

- **easy system planning**
  The required volumetric flow (the required flow limiter nozzle) has to be determined already during the project planning phase.

- **simple start-up**
  Preset volumetric flows allow short start-up times.

- **effective volumetric flow control by means of gear wheel-type flow indicator with Hall-Sensor**

- **broad range of applications**

- **optional ATEX version**

- **stable and reproducible measuring procedure, no corrective factor required**
Flow limiter SP/SMB14

Design

The SP/SMB14 flow limiter consists of the following:

- Flow limiter housing (with sensor) flow limiter regulating assembly (with control piston, plug-in nozzle and pressure spring)
- Gear pair
- Flow limiter cover (with sight glass, seals, plugs and fastening screws).

The housing, gears and cover consist of an anodized aluminum alloy that results in corrosion-resistance and low weight. A round glass disk conforming to DIN 8902 (temperature stable pressed hard glass) is used for the sight-glass pane. The pane floats in the cover to avoid distortion and premature failure. The cover also accommodates a sensor that is actuated by two pin magnets embedded in the gear below. The plug-in nozzle in the flow limiter regulating assembly is simply interchangeable, as soon as the closing screw lying under the plug is unscrewed from the housing.
**Mode of operation**

The flow limiter SP/SMB14 has two restrictors connected in series ($D_1$, $D_2$). Restrictor $D_1$ involves an interchangeable plug-in nozzle, which as a nonadjustable restrictor defines the nominal volumetric flow. The nonadjustable restrictor $D_1$ is available in different nozzle sizes (refer to table on page 4). On the contrary, restrictor $D_2$ is an adjustable restrictor, which has a different restrictor cross-section based on the position of the control piston RK. The flow resistance of restrictor $D_2$ is automatically changed in such a manner by shifting the control piston (RK) against the spring force ($F$), that the differential pressure on the nonadjustable restrictor $D_1$ remains constant, and thus also the volumetric flow.

$$p_1 \cdot A = p_2 \cdot A + F \ \text{resp.} \ p_{1/2} = p_1 - p_2 = \frac{F}{A} = \text{constant}$$

It follows that:
The difference in pressure in front of and behind the plug-in nozzle is held constant by the control piston (RK).
For this function, the system pressure $p_1$ must always be greater than the sum of the pressure drops in and downstream of each flow limiter.

$$p_1 > p_{1/2} + p_3$$

For this reason, the pump's volumetric flow should exceed all the individual flow quantities by approx. 15 %, i.e.,

$$Q = 1,15 \cdot (\Sigma Q_i).$$

The downstream gear wheel-type flow indicator uses a dynamic pulse generator (24 V DC) to emit a continuous sequence of pulses proportional to the volumetric flow.

The proportionality factor $K_1$ is derived from the swallowing capacity of one revolution of the gear pair ($K_1 = 106 \text{ ml/pulse}$).

The sequence of pulses can be displayed and monitored by pulse-monitoring equipment, group monitoring units or a central evaluation station.

Due to the very short throttle length of the plug-in nozzle $D_1$, the control performance in the indicated viscosity range is almost independent of temperature and viscosity.

</table>

1) at a service viscosity of 300 mm²/s

**General information**

Type: 2-way flow limiter valve with volumetric flow check

Application: for line installation

Mounting position: any

Ambient temperature range: 0 to +70 °C

Material: AlCuPb F38, neutrally anodized

Weight: 7.8 kg

**Hydraulic**

Nominal volumetric flow: stepwise from 25 to 132 l/min (see table on page 4)

Working pressure: 6 to 50 bars

Required differential pressure between inlet p₁ and outlet p₃: ≥ 6 bars

Lubricant: mineral oils, synthetic oils and eco-friendly oils

Lubricant temperature range: 0 to +90 °C

Operating viscosity: 20 to 600 mm²/s

**Gear wheel-type flow indicator**

Sensor: Hall-Sensor

System voltage: 24 V DC ± 10%

Max. switched current: 20 mA

Connection: plug, DIN 43 650

Protection class: IP 65

Proportionality factor: 106 ml/pulse

1) Only when ambient temperature < +60 °C

**Note!**

For ordering a flow limiter SP/SMB14, the customer must generate a type designation as well as an order no. This must be adjusted in accordance with the desired flow limiter design. The key to the order codes on page 5 illustrates the structure of the type designation and the order number. For the required nozzle index, see plug-in nozzle table.
Key to order codes

**Order example**
Flow limiter, type SP/SMB and size 14 (SP/SMB14) outfitted with nozzle (2), with optical/electrical monitoring (gear wheel-type flow indicator) with Hall-Sensor (E1), with a volumetric flow of 65 l/min and a nozzle diameter of 9.6 mm (nozzle index 960) gives the Type designation: **SP/SMB14/2E1/960** and Order number: **24-2714-4960**

**Note**
The following flow limiters, type SP/SMB14, are available in ATEX design:

- EX Zone 1
- EX Zone 21

possible design features:
- Housing design with ground terminal
- rating plate, extended
- can be used only in connection with a circuit breaker device
- can be ordered with ATEX certificate

Restrictions regarding temperature and explosion class must be observed.

Further details can be obtained from SKF Lubrication Systems Germany GmbH
Example of a circulating-oil lubrication system

Pump (1) delivers the lubricant to the main line (2). From the flow limiters arranged in parallel (3), the lubricant reaches the lubrication points directly. The pump’s volumetric flow should be at least 15% greater than the sum of nominal volumetric flows of all connected flow limiters. The pressure-regulating valve integrated into the main line (4) assumes the system pressure regulation. The gear wheel-type flow indicator (5) integrated in the flow limiters (3) controls the volumetric flow. Display and control of the pulse sequence (flow limiters (3)) is done by a group monitoring unit (6) or a central evaluation station.

Replacing plug-in nozzles

- Interrupt oil feed of flow limiter (1)

**WARNING**
*Burning oil hazard.*
Failure to slowly remove screw could result in burns.

- Remove screw plug (2) with hexagon socket screw key (SW 10) and pull it out carefully with plug-in nozzle (4) from the flow limiter housing

A brass fitting wedge (never use a hard object like, for instance, a screwdriver) ought to be used to help press out the plug-in nozzle.

- Place the fitting wedge between screw plug (2) and plug-in nozzle (4) and press out the old plug-in nozzle
- Press new plug-in nozzle on a level board without skewing on screw plug (2)
- Place screw plug (2) on flow restrictor thread and tighten with hexagon socket screw key
- Open oil feed to flow limiter

**Note**
In the case of a change in the nozzle size, the nozzle specifications on the rating plate must be changed accordingly.

Important product usage information

All products from SKF may be used only for their intended purpose as described in this brochure and in any instructions. If operating instructions are supplied with the products, they must be read and followed.

Not all lubricants are suitable for use in centralized lubrication systems. SKF does offer an inspection service to test customer supplied lubricant to determine if it can be used in a centralized system. SKF lubrication systems or their components are not approved for use with gases, liquefied gases, pressurized gases in solution and fluids with a vapor pressure exceeding normal atmospheric pressure (1013 mbars) by more than 0.5 bar at their maximum permissible temperature.

Hazardous materials of any kind, especially the materials classified as hazardous by European Community Directive EC 67/548/EEC, Article 2, Par. 2, may only be used to fill SKF centralized lubrication systems and components and delivered and/or distributed with the same after consulting with and receiving written approval from SKF.
