Grease Lubrication Pump FK
for use in progressive, single-line and dual-line centralized lubrication systems

Application
The FK pump unit is a multi-function piston pump whose modular structure makes it very versatile. The FK pump unit can be used as a progressive, single-line or dual-line pump unit with or without integrated reversing valves. The modular structure of the pump also allows it to be retrofitted from one of the above-mentioned lubrication systems to another system without much effort or expense. The pump, which was designed to handle demanding usage, is available with reservoir sizes of 15 kg, 30 kg and 60 kg.

Advantages
• compact, modular construction; especially well-suited for small to medium dual-line centralized lubrication systems
• Operating pressure up to 400 bar
• High operational reliability due to positively driven pump pistons
• Fill level monitoring (using ultrasonic sensor) with three adjustable switching points
• Modular components resulting in quick and easy service
• Modularity allows retrofitting to another system
• Operating conditions from -25 °C to +60 °C
• Internal pressure-regulating valve with return of grease to the reservoir
• Option for attachments such as pressure gauge or filling coupling
• System requirements can be optimally met and the system pressure reduced by internally consolidating up to six pump elements
• Using multiple pump elements increases the redundancy factor (operational security)
• A new screw conveyor design permits the delivery of very highly viscous lubricants
• “All-in-one” solution with pressure-regulating valve, pressure-relief valve or changeover valve and pressure gauge
• Serves as a supply pump for single-line and dual-line centralized lubrication systems
Functional description

The FK pump unit is driven by an electric geared motor (1) that is radially flanged to the left side of the reservoir. A worm drive-shaft (2) flanged to the geared motor delivers the lubricant in the reservoir to the radial piston pump on the opposite side of the reservoir (3) and drives it as well. Piston stroke motions by the radial piston pump (3) are performed using a rotating eccentric shaft (4). Piston return (suction phase) is performed by positively driven pump pistons (5) that run in a plate cam (6). Depending on the volume of lubricant required, the radial piston pump can be equipped with up to six pumping elements (7). Each pump element delivers the lubricant via its dedicated check valve (8) into a common downstream ring line (9). This protects the radial piston pump from potential pressure peaks. The further course of the lubricant depends on the specific pump usage, whether it is used as a progressive, single-line or dual-line pump (see the following pump description for progressive, single-line or dual-line centralized lubrication systems).

FK4 pump unit for progressive centralized lubrication systems
-see FK4 connection drawing on page 4

Lubricant that comes from the ring line (9) is delivered to pump outlet “A/P”. From there it is passed to the downstream progressive feeders. The pump outlet “B/R” is closed on pump design FK4.

FK1 pump unit for single-line centralized lubrication systems
-see FK1 connection drawing on page 4

Lubricant that comes from the ring line (9) is delivered to the inlet of the 3/2 directional solenoid valve flanged to the pump (10). If the directional solenoid valve is actuated, the lubricant flows to pump outlet A/P.

After this, the lubricant is passed on through the main lubricant line to the downstream single-line distributors.

When a 3/2 directional solenoid valve is in a de-energized state, pressure relief of the main lubricant line returns to the lubricant reservoir (T).

FK3 pump unit for dual-line centralized lubrication systems without installed reversing valves
-see FK3 connection drawing on page 5

Lubricant that comes from the ring line (9) is delivered to pump outlet “A/P”. From there it is passed to the downstream external reversing valves. The pump outlet “B/R” is open and serves to return the lubricant into the lubricant reservoir (T).

FK2 pump unit for dual-line centralized lubrication systems with integrated reversing valves
-see FK2 connection drawing on page 5

Lubricant that comes from the ring line (9) is delivered to the inlets of both 3/2 directional solenoid valves (10). If the 3/2 directional solenoid valve corresponding to connection A is actuated, the lubricant flows to outlet A. From there it is passed through the connected main lubricant line to the downstream dual-line distributors. At the same time, pressure in the second main lubricant line is relieved. This is performed via the second, unpressurized directional solenoid valve B and returns to the lubricant reservoir (T). When the required system pressure is reached, both directional solenoid valves switch over so the main lubricant line that has been pressurized is relieved and the unpressurized main lubricant line is pressurized. In a de-energized state, both main lines are relieved.
General technical data

**General information**
- Mounting position: vertical
- Ambient and lubricant temperature range: -25 °C to +60 °C
- Reservoir: for 15 kg, 30 kg or 60 kg
- Number of pumping elements: 1 to 6
- Filling: via filler socket G 1/2”

**Dry weight**
- with reservoir capacity: 15 kg approx. 46.2 kg
- with reservoir capacity: 30 kg approx. 52.3 kg
- with reservoir capacity: 60 kg approx. 64.0 kg

**Gear**
- Type: Screw drive, type 1M
- Gear ratio: 40:1

**Motor**
- see rating plate
- Nominal speed: 1500 RPM
- Rating voltage: 230/400 VAC
- Frequency: 50 Hz
- Nominal output: 0.37 kW
- Rated current: 1.09 A
- Protection class: IP55-F

**Pump**
- Type: Radial piston pump
- Operating pressure: max. 400 bar
- Delivery volume with:
  - 1 pump element: 0.67 kg/hour
  - 2 pump elements: 1.34 kg/hour
  - 3 pump elements: 2.00 kg/hour
  - 4 pump elements: 2.64 kg/hour
  - 5 pump elements: 3.34 kg/hour
  - 6 pump elements: 4.00 kg/hour

**Lubricants**
- Mineral oils or environmentally compatible oils from ISO VG 46 to greases of NLGI Class 2 (consultation required for synthetic oils)
- Operating viscosity: (Oil) ≥ 50 mm²/s
- Worked penetration: (grease) > 220/10 mm

**Ultrasonic sensor**
- see Technical Data on pages 7

See important product usage information the on back cover.

Grease Lubrication Pump FK

Pump unit for centralized lubrication systems with integrated control cabinet
(Version key 4001)

The control cabinet consists of a SKF control unit, main switch, optionally with motor circuit breaker, power supply, coupling relay, control lamps, terminal clamps and fuses. A display with graphics capabilities for operating and monitoring equipment is also available. Switching from half-cycle to full-cycle (in dual-line centralized lubrication systems), configuration of monitoring and pause periods and the display of all notices and fault texts are also programmed.
Attachment options

Lubricant level monitoring
U2 Ultrasonic sensor with 2 switching points

The ultrasonic sensor works with a piezoelectric element as a sonic transmitter and receiver. A decoupling layer made of a special material is used to decouple the ultrasound from the acoustically thinner air medium. The ultrasonic transducer is embedded water-tight in foam in the sensor’s housing. The active area of the ultrasonic sensor is designated as the detection area and is limited by the shortest \( A_1 \) and longest \( A_2 \) sensing distance. Its values depend on the size of the transducer. The transducer transmits a sonic pulse packet and converts the echo pulse back into voltage.

The integrated controller uses the echo time and speed of sound to calculate the distance between the minimum \( A_2 \) and maximum \( A_1 \) fill level.

Order example

For a pump unit of the FK series (FK) for dual-line systems with changeover valves (2), a 15 kg lubricant reservoir (15), ultrasonic lubricant level monitoring with two switching points (min. and max.) (U2), drive type M1 (M1), a 40:1 gear ratio (04), a delivery volume of 4 kg/h (6), a pressure-regulating valve set to 400 bar (400), pressure gauge for both outlet lines (MA + MB) (M2), filler socket and screw cap (3), basic design of pump unit (0001) with a 230/400 VAC drive motor (AF) with protection class IP 55 F (07),

the order number is: FK 2 / 15 U2 1M 04 / 6 / 400 M2 3 / 0001 AF 07
Important product usage information

All products from SKF may be used only for their intended purpose as described in this brochure and in any instructions. If operating instructions are supplied with the products, they must be read and followed.

Not all lubricants are suitable for use in centralized lubrication systems. SKF does offer an inspection service to test customer supplied lubricant to determine if it can be used in a centralized system. SKF lubrication systems or their components are not approved for use with gases, liquefied gases, pressurized gases in solution and fluids with a vapor pressure exceeding normal atmospheric pressure (1013 mbars) by more than 0.5 bar at their maximum permissible temperature.

Hazardous materials of any kind, especially the materials classified as hazardous by European Community Directive EC 67/548/EEC, Article 2, Par. 2, may only be used to fill SKF centralized lubrication systems and components and delivered and/or distributed with the same after consulting with and receiving written approval from SKF.
